People across the world are struggling with the everyday realities of climate change—such as higher temperatures, changes in rain patterns, rising sea levels, and more frequent weather-related disasters. The poor in developing countries are hit hardest and face difficult challenges. At stake are recent gains in the fight against poverty, hunger and disease, and the lives and livelihood of billions of people. Low emissions economic development that is climate-friendly and -resilient will require huge leaps forward in innovation, knowledge sharing, and capacity building.

The WBI Climate Change (WBICC) Practice responds to these challenges, and opportunities by integrating and packaging the best available knowledge on adaptation and mitigation. One of the key product lines in a full capacity building menu are our e-learning courses, which are clustered in four pillars: (i) Essentials of Climate Change; (ii) Low Emissions Development; (iii) Energy; and, (iv) Climate-Smart Agriculture in Landscape Management.
